## GETTING STARTED - INTRODUCTION Design & Engineering Guide Page

### **Getting Started - Introduction**

This manual is for professional engineers and permitting authorities. For assistance with your array's engineering and a Bill of Materials, see our U-Builder at <a href="http://design.unirac.com">http://design.unirac.com</a>

SOLARMOUNT Flush-to-Roof is an extruded aluminum rail system that is engineered to hold most framed solar modules to a roof structure and installed parallel to the roof. With SOLARMOUNT, you'll be able to solve virtually any PV module mounting challenge.

Some of the features of this product include:

- Integrated Full System Grounding and Bonding to UL 2703
  - Integrated Bonding Rail Splice
  - o Integrated Bonding Module Midclamp Assembly
  - o Module Endclamp Assembly
  - o Bonding Microinverter Mounting Bolt Assembly
  - o Integrated Bonding L-Foot T-Bolt
- Module Landscape (with rails running north/south) or Portrait (with rails running east/west) Orientations
- Works with Most Framed Modules
- Wire Management Clip
- Designed per the ASCE 7-05 and ASCE 7-10 Building Code
- Component Testing
- Rigorous Engineering Analysis
- Superior Aesthetics
  - o Optional Front Trim
  - o Optional End Caps (SOLARMOUNT Standard and Light Rail Only)

## **INSTALLER RESPONSIBILITY** DESIGN & ENGINEERING GUIDE PAGE

### Installer Responsibility & Disclaimer

Please review this guide and the SOLARMOUNT Installation Guide thoroughly before installing your SOLARMOUNT system. These guides provide supporting documentation for building permit applications, planning, and assembling the SOLARMOUNT system.

The installer is solely responsible for:

- Complying with all applicable local or national building codes, including code requirements that can be more stringent than the guidelines set forth in this manual;
- Maintaining and enforcing all aspects of a safe working environment;
- Ensuring that Unirac and other products are appropriate for the particular installation and the installation environment;
- Ensuring that the roof, its rafters, connections, and any other structural support members can support the array under all code level loading conditions (this total building assembly is referred to as the building structure);
- Using only Unirac parts and installer-supplied parts as specified by Unirac (substitution of parts may void the warranty and invalidate the letters of certification in all Unirac publications);
- Ensuring that lag screws have adequate pullout strength and shear capacities as installed;
- Verifying the strength of any alternate mounting if used in lieu of the lag screws;
- Maintaining the waterproof integrity of the roof, including selection and proper installation of appropriate flashing;
- Ensuring safe installation of all electrical aspects of the PV array, including proper grounding/bonding;
- Array shading and output analysis;
- Ensuring correct and appropriate design parameters are used in determining the design loading used for design of the specific installation. Parameters, such as snow loading, wind speed, exposure and topographic factor should be confirmed with the local building official or a licensed professional engineer.

Unirac shall not be liable for any losses, damages, or injuries that directly or indirectly result from any non-conformance with the above.

## DESIGN & ENGINEERING GUIDE 3 DESIGN & ENGINEERING GUIDE

### Design Methodology

SOLARMOUNT was designed using the *Minimum Design Loads for Buildings and Other Structures* by the *American Society of Civil Engineers and Structural Engineering Institute,* 2005 and 2010 editions. These are referred to as ASCE 7-05 and ASCE 7-10, respectively. Three methods have been provided to aid in design of your project. The use of these methods is discussed in the *Project Requirements & Design Aid* section in the next page.

Quick Note – The online U-Builder is highly recommended for all qualifying projects. It will provide you with a Bill of Materials, Certification Letter, and Calculations for your project. Please review Table 1 in the *Project Requirements and Design Aid* section of this Guide.

\* Requirements must fall within defined range to utilize specified design aid.

\*\* The design professional could use the appropriate code to perform the design in LRFD, LSD, or ASD. The ASD procedure for the Analytical Method has been provided.

\*\*\* Prescriptive Pressure tables located in Appendix B and Online. Pressure Tables exist for Basic Wind Speeds of 85-170 mph for ASCE 7-05 and 110-190 mph for ASCE 7-10.

1a. U-Builder: This is an easy-to-use online design tool that is recommended for all preliminary and final designs, estimating, and layout validation. It is located on our website at www.unirac.com.

The U-Builder allows for a customized project design that results in a final design, bill of materials, price quote and stamped/certified engineering approval letters.

<u>1b.</u> Prescriptive Design Method: This method is a simplified approach to the design of your SOLARMOUNT project. This method is recommended when computers or internet access is not available. Once project specific requirements are known, the project design load pressures can be looked up in the Pressure Lookup Tables located in Appendix B. If additional tables are needed, they can be found online at www.unirac.com.

<u>1c.</u> Do It Yourself (Analytical Method): This design approach follows the ASD calculations step by step through both the ASCE 7-05 and 7-10 design codes. Equations, figures, tables, and commentary are provided for your convenience to aid in generating the specific design load pressures for your loading conditions, such as wind and snow. This method has been provided for design or layout requirements that fall outside of the other two options or for design professionals that prefer to perform their own calculation package.

## **PRESCRIPTIVE DESIGN METHOD** Design & Engineering Guide

### Prescriptive Design Method - Quick Design Steps

#### Step 1: Define Project Requirements

- a. Fill in the Table 1 Project Requirements & Design Aid on previous page.
- b. Once project specific information is determined, confirm that the Prescriptive Design Method may be utilized.
- c. Review the Prescriptive Pressure Tables in the Appendix to see if they meet your needs. If a more precise design is needed (if the tables in the Appendix don't meet your project requirements, but per Table 1, you can still utilize the Prescriptive Design Method) please utilize the online tool for design.

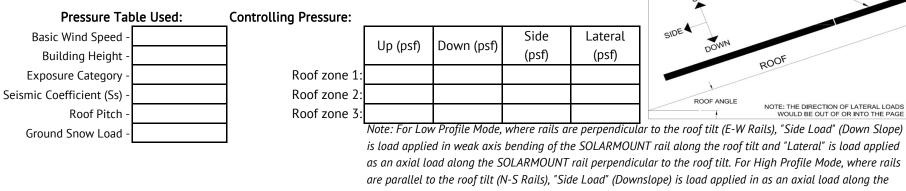

#### Step 2: Create Initial Array Layout

- a. Identify the structural supporting members of your building. A sketch/drawing of the roof/building with location of supporting members, vents, skylights, cable/wires, areas to avoid, etc., is highly recommended.
- b. Create a "rough draft" layout of solar modules on the actual project roof. (Refer to the SOLARMOUNT Installation Guide.)

# **PRESCRIPTIVE DESIGN METHOD** Design & Engineering Guide

#### Determine Array Design Pressure by Roof Zone to Select a Rail Span <u>Step 3:</u>

- a. Using information in Steps 1 & 2, select a Prescriptive Pressure Table contained Appendix B or online.
- b. Use fill-in boxes below to document your project specific pressures and tables utilized.

SOLARMOUNT rail perpendicular to the roof tilt and "Lateral Load" is applied in weak axis bending of the SOLARMOUNT rail along the roof tilt.

- c. Convert pressures (lbs/ft<sup>2</sup> or psf) from the boxes just filled in to pounds per linear foot (lb/ft or plf) using the following steps:
  - i. Pressure (from table above) \* Area of Module = Total Pounds per Module
  - ii. Total Pounds Per Module / 2 (Number of rails) = Pounds Per Rail
  - iii. Pounds Per Rail / Width of Module Parallel with the Rail = Pounds per Linear Foot (plf)
- d. Use the *Downward and Upward Span Length Tables* in Appendix C with the plf loads to determine maximum spans.
  - i. Look up the table "Downward Span Lengths". Using the "Down" plf load and the "Side" plf load combinations, choose the maximum span length in the table.
  - ii. Look up the table "Uplift Span Lengths" and using the "Up" plf and "Side" plf load combinations to choose the maximum span length.
  - iii. Use the smaller length of the "Down" and "Up" maximum span length.
  - iv. Cantilever (overhang) lengths can be up to 33% of the span length. For example, a 9 foot span length can have a 3 foot cantilever. The cantilever is defined as the distance from the center of a L-Foot to the edge of a rail.

MODULE

## PRESCRIPTIVE DESIGN METHOD Design & Engineering Guide

#### Step 4: Determine Load to the Roof

\*The U-Builder online can automatically calculate maximum point loads to the roof.

- a. To determine the load on the roof through the attachment:
  - i. Determine the tributary area to each attachment.
  - ii. Review the controlling pressure in Step 3b.
  - iii. Determine pressure zones on the roof per ASCE 7-05, Figure 6-3 or ASCE 7-10, Figure 30.5-1.
  - iv. Multiply the tributary area by the roof pressure to obtain loads to the roof attachment.
  - v. Determine the point load to the roof at each attachment.

#### Step 5: Check Roof Load

a. Ensure that the supporting structure is capable of withstanding the additional loads imposed by the proposed solar system.

#### Step 6: Check the Connections

a. Similar to Step 3c, determine the tributary area to each connection and the applied load from the Controlling Pressures table in Step 3.

b. Convert the applied psf loads into pounds through tributary area.

c. Look up the Technical Data Sheets in Appendix H for maximum permissible load to each connection.

d. From Step 4, determine if the attachment (lag bolt or other appropriate attachment) is capable of withstanding the point loads applied.

e. If the maximum permissible load is greater than the applied load, then the connections are adequate.

#### Step 7: Define Grounding and Bonding Path

a. Refer to the Installation Guide for how to determine the Grounding and Bonding Path.

#### SOLARMOUNT Front Trim Check

a. SOLARMOUNT Front Trim should not be installed in areas where the wind load exceeds 100 psf, where the distance from clamp to clamp (span) exceeds 52 inches, or where the cantilever (overhang) is greater than 66% of the span length. To determine your pressure, please use Appendix B. You will need to review the table assosciated with your project wind speed and no snow, and review the Up and Down Loads (psf) to determine if SOLARMOUNT Front Trim is appropriate for your project.

## ASCE 7-05 ANALYTICAL METHOD Design & Engineering Guide

## ASCE 7-05 Analytical Method

#### Step 1: User Inputs (ASCE 7-05)

or a p
load
remo
panel
nitions ratior
and roof f
reduc
load
5, Figure same
can b array,
l, 22-13,
5

#### Commentary:

1) Most Building Officials allow for all or a portion of the roofs original live load design load to be removed/reduced at the time that solar panels are being added to the roof. The rationale behind this is that live load or roof foot traffic is eliminated or reduced to designated paths. in other words, the roof top solar array and live load foot traffic cannot occupy the same space. If all of the roof live load can be utilized by the proposed solar array, 0 psf should be entered.

## ASCE 7-05 ANALYTICAL METHOD DESIGN & ENGINEERING GUIDE

#### Step 2: Wind Pressure (ASCE 7-05, Chapter 6)

Wind Pressure Equation - Method 2 - Analytical Procedure (ASCE 7-05, Section 6.5): Pp=qh (GCpp-GCpi) (ASCE 7-05, Section 6.5.12.4.1) (GCpp - Positive Downforce Factor) Pn=qh (GCpn-GCpi) (ASCE 7-05, Section 6.5.12.4.1) (GCpn - Negative Uplift Factor) Gcpi equals zero (per AC428, November 2012) (internal pressure coefficient) GCp is defined below (ASCE 7-05 Figure 6-11) and is a function of the roof zone, effective wind area (feet squared), and roof angle (degrees) (external pressure coefficient) GCpp (Positive downforce factor) GCpn (Negative uplift factor) (ASCE 7-05, Figure 6-11B) for roof angles  $\leq 7^{\circ}$ (ASCE 7-05, Figure 6-11C) for roof angles > 7° and  $\leq$  27° (ASCE 7-05, Figure 6-11D) for roof angles > 27° and  $\leq$  45° qh = qz qz=0.00256Kz\*Kzt\*Kd\*V^2\*I (ASCE 7-05, Section 6.5.10) Κz Velocity Pressure Coefficient (ASCE 7-05, Table 6-3) Topographic Factor (ASCE 7-05, Section 6.5.7.1 & Figure 6-Kzt 4) Kd Directionality Factor (ASCE 7-05, Table 6-4) Basic Wind Speed in MPH from User Inputs in Step 1 v Importance Factor<sup>2</sup> (ASCE 7-05, Table 6-1)

Commentary:

2) Typical values for the Importance Factor are 0.87 based on Occupancy Category I and 1.0 based on Occupancy Category II. Occupancy I is defined by ASCE 7-05 to mean "Buildings and other structures that present a low hazard to human life in the event of failure...". Occupancy II is defined by ASCE 7-05 to mean "All buildings and other structures except those listed in Occupancy Categories I, III, and IV".

Calculate the wind pressure for uplift and downforce, using GCpn & GCpp respectively, in the provided boxes.

# ASCE 7-05 ANALYTICAL METHOD

<u>Step 3:</u> Dead Load

(psf):

#### Commentary:

3) To be combined with the module dead load and used in wind load combinations.

4) The ground snow load is utlilized to calculate the roof snow load, which is the load applied to the structure.

5) From Section C7.8 of ASCE 7-05, "the collectors should be designed to sustain a load calculated by using the "unobstructed slippery surfaces" curve in Fig. 7-2a". This graph recommends the use of a Ct value of less than or equal to 1.0.

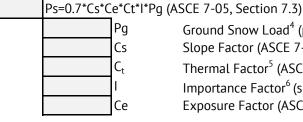

6) The Snow Importance Factor for Occupancy Category I = 0.8 and for Occupancy Category II = 1.0.

Module Dead Load (psf) should be determined from User Inputs in Step Module Dead Load (psf): 1 [See Appendix E] (The racking system dead load should be taken as Racking System Dead Load<sup>3</sup> the total weight of the racking system (hardware, rails, nuts, bolts, attachments, etc.) divided by the total module area of the system.) Component weights can be found in the technical datasheets. Sum of Module Dead Load and Racking System Dead Load Total Dead Load (psf):

Calculated Dead Load in the provided boxes.

#### Step 4: Snow Load (ASCE 7-05, Chapter 7)

#### Sloped Roof Snow Load Pressure Equation:

Ground Snow Load<sup>4</sup> (psf) from User inputs in Step 1. Slope Factor (ASCE 7-05, Figure 7-2) Thermal Factor<sup>5</sup> (ASCE 7-05, Table 7-3) Importance Factor<sup>6</sup> (snow) (ASCE 7-05, Table 7-4) Exposure Factor (ASCE 7-05, Table 7-2)

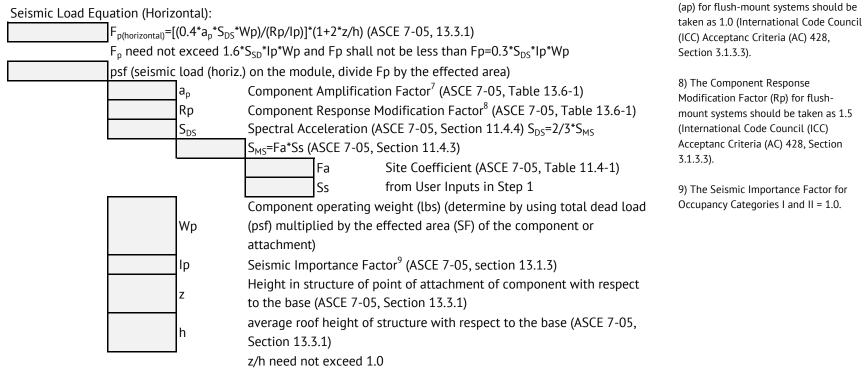

Calculate Ps (Sloped roof snow load) in the provided boxes.

## ASCE 7-05 ANALYTICAL METHOD DESIGN & ENGINEERING GUIDE

Commentary:

7) The Component Amplification Factor

#### Step 5: Seismic Load (ASCE 7-05)

Seismic Load Equation (Vertical):

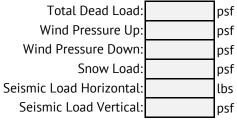

$F_{p(vertical)}=\pm 0.2^{*}S_{DS}^{*}Wp$ (ASCE 7-05, Section 12.4.2.2)
psf (seismic load (vert.) on the module, divide Fp by the effected area)

Calculate seismic loads for both horizontal and vertical in the provided boxes.

## ASCE 7-05 ANALYTICAL METHOD DESIGN & ENGINEERING GUIDE

#### Step 6: Rewrite Your Loads

\*Depending on your coordinate system, certain loads will need to be split into their horizontal and vertical components.

#### Step 7: Allowable Stress Design (ASD) Load Combinations (ASCE 7-05, Chapter 2, Section 2.4.1)

\*The load combinations below have been identified as the likely controlling cases for the roof structure.

1) D	8) D + 0.75(0.7E) + 0.75Lr	D = Dead Load
2) D + Lr	9) D + 0.75(0.7E) + 0.75S	Lr = Live Load to Roof
3) D + S	10) D + 0.7E	S = Snow Load
4) D + W <sub>up</sub>	11) 0.6D + W <sub>up</sub>	W <sub>up</sub> = Wind Load Up
5) D + W <sub>down</sub>	12) 0.6 D + W <sub>down</sub>	W <sub>down</sub> = Wind Load Down
6) D + 0.75W <sub>down</sub> + 0.75S	13) 0.6 D + 0.7E	E = Earthquake/Seismic Load
7) D + 0.75W <sub>down</sub> + 0.75Lr		

#### Step 8: Create Initial Array Layout

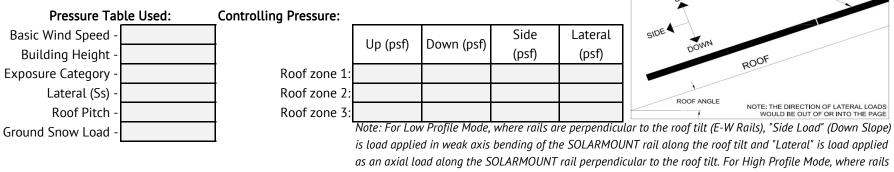

- a. Identify the structural supporting members of your building. A sketch/drawing of the roof/building with location of supporting members, vents, skylights, cable/wires, areas to avoid, etc., is highly recommended.
- b. Create a "rough draft" layout of solar modules on the actual project roof. (Refer to the SOLARMOUNT Installation Guide.)

## ASCE 7-05 ANALYTICAL METHOD Design & Engineering Guide

#### Step 9: Determine a Rail Span

\*For structural engineers who would like to determine the rail span without utilizing the Prescriptive Method, section properties can be found in Appendix F - Technical Data Sheets.

- a. Using information in Step 1 & 8, select a Prescriptive Pressure Table contained the Appendix B or
- b. Use fill-in boxes below to document your project specific pressures and tables utilized.

as an axial load along the SOLARMOUNT rail perpendicular to the roof tilt. For High Profile Mode, where rail are parallel to the roof tilt (N-S Rails), "Side Load" (Downslope) is load applied in as an axial load along the SOLARMOUNT rail perpendicular to the roof tilt and "Lateral Load" is applied in weak axis bending of the SOLARMOUNT rail along the roof tilt.

- c. Convert pressures (lbs/ft<sup>2</sup> or psf) from the boxes just filled in to pounds per linear foot (lb/ft or plf) using the following steps:
  - i. Pressure (from table above) \* Area of Module = Total Pounds per Module
  - ii. Total Pounds Per Module / 2 (Number of rails) = Pounds Per Rail
  - iii. Pounds Per Rail / Width of Module Parallel with the Rail = Pounds per Linear Foot (plf)
- d. Use the *Downward and Upward Span Length Tables* in Appendix C with the plf loads to determine maximum spans.
  - i. Using the plf loads for "Down", look up the table "Downward Span Lengths" in Appendix B and using the "Down" plf load and the "Side" plf load combinations to choose the maximum span length.
  - ii. Using the plf loads for "Up", look up the table "Uplift Span Lengths" in Appendix and using the "Up" plf and "Side" plf load combinations to choose the maximum span length.
  - iii. Use the smaller length of the "Down" and "Up" maximum span length.
  - iv. Cantilever (overhang) lengths can be up to 33% of the span length. For example, a 9 foot span length can have a 3 foot cantilever. The cantilever is defined as the distance from the center of a L-Foot to the edge of a rail.

MODULE

## ASCE 7-05 ANALYTICAL METHOD DESIGN & ENGINEERING GUIDE

#### <u>Step 10:</u> Look-up Layout and Attachment Guidelines for Array

a. Review your layout in Step 8 above and the Layout and Attachment Guidelines to determine potential attachment points to your structure.

#### Step 11: Determine Load to the Roof

- a. To determine the load on the roof through the attachment:
  - i. Determine the tributary area to each attachment.
  - ii. Review the controlling pressure in Step 9.
  - iii. Determine pressure zones on the roof per ASCE 7-05, Figure 6-3.
  - iv. Multiply the tributary area by the roof pressure to obtain loads to the roof attachment.
  - v. Determine the point load to the roof at each attachment.

#### Step 12: Check Roof Load

a. Ensure that the supporting structure is capable of withstanding the additional loads imposed by the proposed solar system.

#### Step 13: Check the Connections

- a. Similar to Step 9c, determine the tributary area to each connection and the applied load from the Controlling Pressures table in Step 9.
- b. Convert the applied psf loads into pounds through tributary area.
- c. Look up the Technical Data Sheets in Appendix H for maximum permissible load to each connection.
- d. From Step 11, determine if the attachment (lag bolt or other appropriate attachment) is capable of withstanding the point loads applied.
- e. If the maximum permissible load is greater than the applied load, then the connections are adequate.

#### **<u>Step 14:</u>** Define Grounding and Bonding Path

a. Refer to the SOLARMOUNT Installation Guide for how to determine the Grounding and Bonding Path.

#### SOLARMOUNT Front Trim Check

a. SOLARMOUNT Front Trim should not be installed in areas where the wind load exceeds 100 psf, where the distance from clamp to clamp (span) exceeds 52 inches, or where the cantilever (overhang) is greater than 66% of the span length. Please review the Step 6 Up and Down Wind Loads (psf) to determine if Front Trim is appropriate for your project.

#### ~ entary:

st Building Officials allow for all ortion of the roofs original live esign load to be ed/reduced at the time that solar are being added to the roof. The ale behind this is that live load or oot traffic is eliminated or ed to designated paths. in other , the roof top solar array and live pot traffic cannot occupy the space. If all of the roof live load utilized by the proposed solar 0 psf should be entered.

## ASCE 7-10 ANALYTICAL METHOD Design & Engineering Guide

#### Step 2: Wind Pressure (ASCE 7-10, Chapter 30)

Wind Pressure Equation - Components & Cladding (ASCE 7-10, Section 30.4.2):

Calculate the wind pressure for uplift and downforce, using GCpn & GCpp respectively, in the provided boxes.

# ASCE 7-10 ANALYTICAL METHOD Design & Engineering Guide

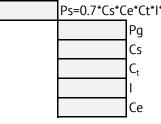

#### <u>Step 3:</u> Dead Load

		<u>com</u>
Module Dead Load (psf):	Module Dead Load (psf) should be determined from User Inputs in Step	2) To
	1	dead
Racking System Dead Load <sup>2</sup>	[See Appendix E] (The racking system dead load should be taken as	com
(psf):	the total weight of the racking system (hardware, rails, nuts, bolts,	3) Th
	attachments, etc.) divided by the total module area of the	calcı
	system.)Component weights can be found in the technical datasheets.	the l
Total Dead Load (psf):	Sum of Module Dead Load and Racking System Dead Load	4) Th

Calculated Dead Load in the provided boxes.

#### Snow Load (ASCE 7-10, Chapter 7) Step 4:

#### Sloped Roof Snow Load Pressure Equation:

Ps=0.7\*Cs\*Ce\*Ct\*I\*Pg (ASCE 7-10, Sections 7.3 & 7.4 Flat and Sloped Roof Snow Load) Ground Snow Load<sup>3</sup> (psf) from User inputs in Step 1. Slope Factor (ASCE 7-10, Figure 7-2) Thermal Factor (ASCE 7-10, Table 7-3) Importance Factor<sup>4</sup> (snow) (ASCE 7-10, Table 1.5-2) Exposure Factor (ASCE 7-10, Table 7-2)

Calculate Ps (Sloped roof snow load) in the provided boxes.

#### Commentary:

To be combined with the module ad load and used in wind load mbinations.

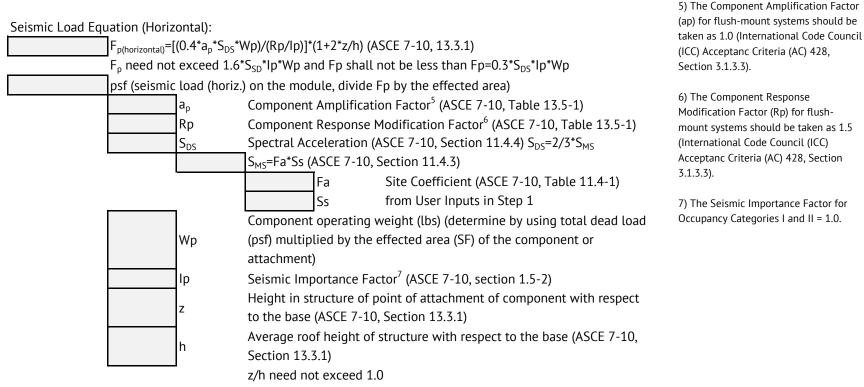

The ground snow load is utlilized to lculate the roof snow load, which is load applied to the structure.

The Snow Importance Factor for Occupancy Category I = 0.8 and for Occupancy Category II = 1.0.

## ASCE 7-10 ANALYTICAL METHOD DESIGN & ENGINEERING GUIDE

Commentary:

#### Step 5: Seismic Load (ASCE 7-10)

Seismic Load Equation (Vertical):

F <sub>p(vertical)</sub> =±0.2*S <sub>DS</sub> *Wp (ASCE 7-10, Section 12.4.2.2)
psf (seismic load (vert.) on the module, divide Fp by the effected area)

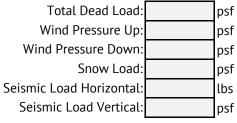

Calculate seismic loads for both horizontal and vertical in the provided boxes.

## PAGE 18

## ASCE 7-10 ANALYTICAL METHOD DESIGN & ENGINEERING GUIDE

#### Step 6: Rewrite Your Loads

\*Depending on your coordinate system, certain loads will need to be split into their horizontal and vertical components.

#### Step 7: Allowable Stress Design (ASD) Load Combinations (ASCE 7-10, Chapter 2, Section 2.4.1)

\*The load combinations below have been identified as the likely controlling cases for the roof structure.

1) D	8) D + 0.75(0.7E) + 0.75Lr	D = Dead Load
2) D + Lr	9) D + 0.75(0.7E) + 0.75S	Lr = Live Load to Roof
3) D + S	10) D + 0.7E	S = Snow Load
4) D + 0.6W <sub>up</sub>	11) 0.6D + 0.6W <sub>up</sub>	W <sub>up</sub> = Wind Load Up
5) D + 0.6W <sub>down</sub>	12) 0.6 D + 0.6W <sub>down</sub>	W <sub>down</sub> = Wind Load Down
6) D + 0.75(0.6)W <sub>down</sub> + 0.75S	13) 0.6 D + 0.7E	E = Earthquake/Seismic Load
7) D + 0.75(0.6)W <sub>down</sub> + 0.75Lr		

#### Step 8: Create Initial Array Layout

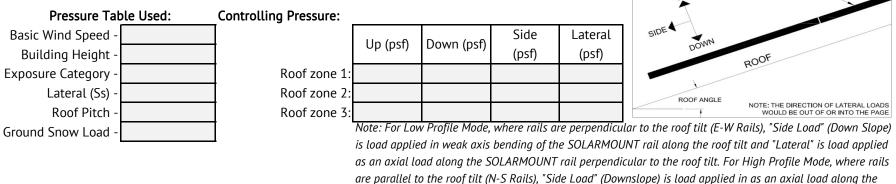

- a. Identify the structural supporting members of your building. A sketch/drawing of the roof/building with location of supporting members, vents, skylights, cable/wires, areas to avoid, etc., is highly recommended.
- b. Create a "rough draft" layout of solar modules on the actual project roof. (Refer to the SOLARMOUNT Installation Guide.)

## ASCE 7-10 ANALYTICAL METHOD DESIGN & ENGINEERING GUIDE

#### Step 9: Determine a Rail Span

\*For structural engineers who would like to determine the rail span without utilizing the Prescriptive Method, section properties can be found in Appendix F - Technical Data Sheets.

- a. Using information in Step 1 & 8, select a Prescriptive Pressure Table contained Appendix B or
- b. Use fill-in boxes below to document your project specific pressures and tables utilized.

are parallel to the roof tilt (N-S Rails), "Side Load" (Downslope) is load applied in as an axial load along th SOLARMOUNT rail perpendicular to the roof tilt and "Lateral Load" is applied in weak axis bending of the SOLARMOUNT rail along the roof tilt.

- c. Convert pressures (lbs/ft<sup>2</sup> or psf) from the boxes just filled in to pounds per linear foot (lb/ft or
  - plf) using the following steps:
  - i. Pressure (from table above) \* Area of Module = Total Pounds per Module
  - ii. Total Pounds Per Module / 2 ( Number of rails) = Pounds Per Rail
  - iii. Pounds Per Rail / Width of Module Parallel with the Rail = Pounds per Linear Foot (plf)

d. Use the *Downward and Upward Span Length Tables* in Appendix C with the plf loads to determine maximum spans.

- i. Using the plf loads for "Down", look up the table "Downward Span Lengths" in the Appendix and using the "Down" plf load and the "Side" plf load combinations to choose the maximum span
- ii. Using the plf loads for "Up", look up the table "Uplift Span Lengths" in the Appendix and using the "Up" plf and "Side" plf load combinations to choose the maximum span length.
- iii. Use the smaller length of the "Down" and "Up" maximum span length.
- iv. Cantilever (overhang) lengths can be up to 33% of the span length. For example, a 9 foot span length can have a 3 foot cantilever. The cantilever is defined as the distance from the center of a L-Foot to the edge of a rail.

MODULE

## ASCE 7-10 ANALYTICAL METHOD Design & Engineering Guide

#### **<u>Step 10:</u>** Look-up Layout and Attachment Guidelines for Array

a. Review your layout in Step 8 above and the Layout and Attachment Guidelines to determine potential attachment points to your structure.

#### Step 11: Determine Load to the Roof

- a. To determine the load on the roof through the attachment:
  - i. Determine the tributary area to each attachment.
  - ii. Review the controlling pressure in Step 9.
  - iii. Determine pressure zones on the roof per ASCE 7-10, Figure 30.5-1.
  - iv. Multiply the tributary area by the roof pressure to obtain loads to the roof attachment.
  - v. Determine the point load to the roof at each attachment.

#### Step 12: Check Roof Load

a. Ensure that the supporting structure is capable of withstanding the additional loads imposed by the proposed solar system.

#### Step 13: Check the Connections

- a. Similar to Step 9c, determine the tributary area to each connection and the applied load from the Controlling Pressures table in Step 9.
- b. Convert the applied psf loads into pounds through tributary area.
- c. Look up the Technical Data Sheets in Appendix H for maximum permissible load to each connection.
- d. From Step 11, determine if the attachment (lag bolt or other appropriate attachment) is capable of withstanding the point loads applied.
- e. If the maximum permissible load is greater than the applied load, then the connections are adequate.

#### **<u>Step 14:</u>** Define Grounding and Bonding Path

a. Refer to the SOLARMOUNT Installation Guide for how to determine the Grounding and Bonding Path.

#### SOLARMOUNT Front Trim Check

a. SOLARMOUNT Front Trim should not be installed in areas where the wind load exceeds 100 psf, where the distance from clamp to clamp (span) exceeds 52 inches, or where the cantilever (overhang) is greater than 66% of the span length. Please review the Step 6 Up and Down Wind Loads (psf) to determine if Front Trim is appropriate for your project.

## **TECHNICAL SUPPORT** DESIGN & ENGINEERING GUIDE PAGE

### **Technical Support**

If you have further questions regarding the SOLARMOUNT product, please contact your distributer. If further clarification is needed, please review the Unirac website online resources at:

#### http://unirac.com/solarmount

The Unirac website contains up-to-date manuals, design guides, webinars, online calculations, information, certification letters, technical data sheets, additional products that Unirac provides, and anything else you might need for your project.

# APPENDIX – TABLE OF CONTENTS 23 Design & Engineering Guide Page

### Appendix – Table of Contents

Appendix A – Product Catalog of Parts List
Appendix B – Pressure Lookup Tables
Appendix C – Downward & Upward Span Length Tables
Appendix D – Roof Pitch to Angle
Appendix E – Dead Load Analysis
Appendix F – Enphase Energy Microinverter Testing
Appendix G – System Certification
Appendix H – Technical Data Sheets
Appendix I – SOLARMOUNT HD Rail

Please refer to the Master Price List at www.unirac.com for a list of part numbers, part descriptions, and prices.

85 mph

5 psf

10 plf Horizontal Load (weak axis)

11.5 ft Max Span = min (downforce, uplift)

with SOLARMOUNT Heavy Duty (HD) Rail

#### SOLARMOUNT FRONT TRIM

SOLARMOUNT Front Trim should not be installed in areas where the wind load exceeds 100 psf, where the distance from clamp to clamp (span) exceeds 52 inches, or where the cantilever (overhang) is greater than 66% of the span length.

### Roof Pitch to Angle Conversion:

12:12 = 45°
11:12 = 42.50°
10:12 = 39.81°
9:12 = 36.87°
8:12 = 33.69°
7:12 = 30.26°
6:12 = 26.57°
5:12 = 22.62° Still Walkable
4:12 = 18.43° Standard Roof Pitch
3:12 = 14.04° Typical in Southern Climates
2:12 = 9.46° Low Roof Pitch

The Pressure Lookup Tables and U-Builder include service dead loads ranging from 2.1 to 3.8 psf and include the weight of SOLARMOUNT Standard Rail, SOLARMOUNT connections, and the weight of the module.

To calculate the dead load of your system, please refer to Appendix H - Technical Data Sheet and the project specific Module Specification Sheet. If your loads fall outside the range listed above, please use the Analytical Method in the SOLARMOUNT Design and Engineering Guide for analysis.

# Installation Parameters for Equipment Grounding Fault Test

system can be utilized to clear a 20A fault condition occurring on the metallic racking or module frames Enphase Energy is looking to perform fault testing to verify that our microinverter enclosure and cabling within a system in which all of the metallic equipment is bonded using devices listed for bonding the components. These bonding devices can be either WEEB grounding clips or UL-2703 listed bonding components, but the primary test scenario is designed to utilize WEEB grounding clips.

## Installation Parameters

ideally, we would like to show that a single microinverter can clear a fault condition occurring on the second rail of the racking system. WEEB grounding clips would be used for bonding the modules, microinverters, and racking system. WEEB DMC dips with Unitac SolarMount Rails would be an acceptable pairing

The wire length between the microinverter and the overcurrent protective device should be maintained to at least 2% voltage drop, but 3% voltage drop (based upon 16A) would be ideal.

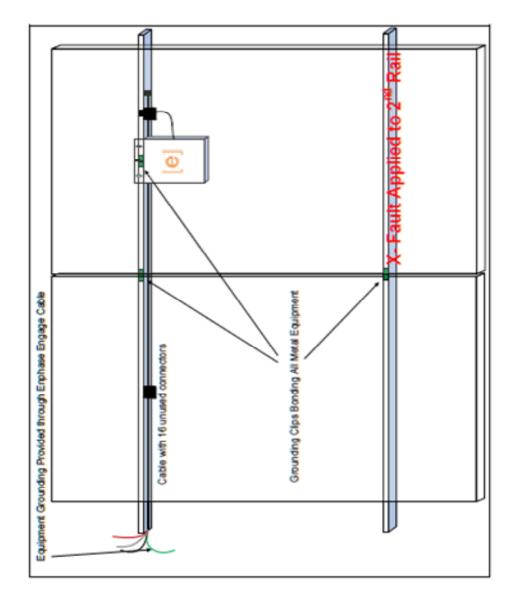

If the primary test scenario is adequate to properly open the breaker, then no additional testing would be required.

## Primary Test Scenio - One Inverter to clear fault, 3% voltage drop

Installation Requirements for the primary test scenario

- 2 modules (could be used Sharp 235s from Enphase inventory) .
  - 2 rail 2 x 8' sections of Unirac U-SMR Rail
- Flat-lid microinverter (M215 and/or M250 acceptable)
- 3 WEEB-DMC grounding dips between metal components and installed as per Burndy installation requirements
  - 1 WEEB Grounding Lug for bonding of fault to 2<sup>rd</sup> rail
- Enphase Engage Cable with 17 portrait connectors in portrait (.81% voltage drop when fully
  - populated. The microinverter is to be installed at the 17<sup>th</sup> connector in the cable.
    - 133° of #10 CU conductors
- Designed for 3% Voltage Drop total including Engage Cable
- 81% on Engage Cable with 17 portrait connectors (from Enphase Vrise Technical Brief)
  - 2.19% voltage drop on #10 conductors
    - 133° of #10 CU conductors
      - Could be type NM cable.
- Vdrop % = 16A x 2 way wire length in kFt x Resistance OAFt / 240V
  - 2.19% = 16A x 2 x Distance x 1.24 Ω/kR / 240V
    - One Way Distance of #10CU = 133 #
      - Fault applied to 2<sup>nd</sup> rail .
- Bonding of modules to rail with 1 WEEB dip per mid clamp
- Bonding of microinverter to rail with 1 WEEB clip . .

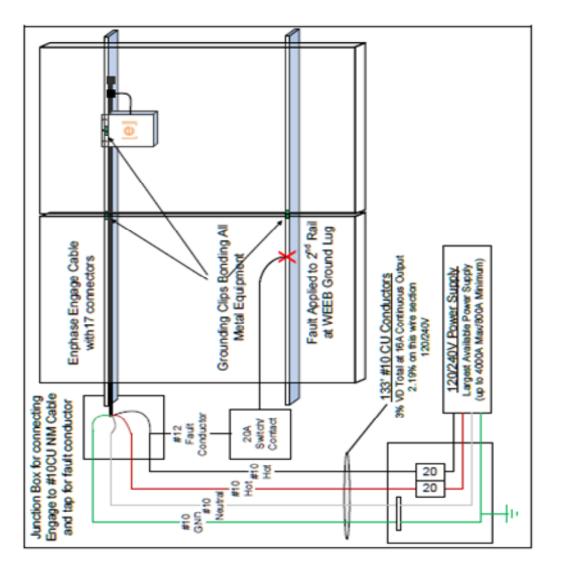

## Conceptual Drawing

SOLAR

**APPENDIX F** Enphase Energy Microinverter Testing

141-001NS Rev 00

## Other Potential Test Scenarios

Additional test scenarios may be required or preferred. Atternate test parameters may include the following:

- We may want to test both M215 and M250 microinverters .
- Decreasing Voltage Drop from 3% to 2% with use of 72' one way wire length of #10CU conductors .
  - Apply fault to module frame Apply fault to 1<sup>st</sup> rail . .
- Install 2 or more microinverters on the cable / rail section ٠
- Use UL-2703 racking system in place of WEEB bonding clips (potentially Unirac rail-less system)
  - Test with approved Siemens AFCI Breaker . .

## Equipment Grounding in an Enphase System

## Overview

and less prone to the fire hazards that come with higher voltage DC photovoltaic systems. Many of these Microinverter system provides a system that is safer for service personnel, safer for fire fighter personnel. The Enphase An Enphase Energy Microinverter system offers the safest photovoltaic system available. safety advantages are widely known:

- DC voltages are maintained at low, safe levels
- Conduits and conductors are de-energized when the main breaker is shut-off.
- Enphase Microinverter systems are free of DC arc-fault hazards and requirements

However, one advantage that is rarely discussed is the high levels of ground bonding that exists in an Enphase Microinverter system.

this equipment, also. When the microinverters, racking, and modules are properly bonded together, then the equipment grounding may also be provided through the microinverter. This can provide a significant cost savings to the labor and balance of system costs in an Enphase Microinverter system. and when properly bonded to racking and to modules frames provides for robust equipment grounding to Each and every microinverter in an Enphase system is bonded to ground through the Enphase Engage cabling system. The Enphase Engage cable provides for a robust grounding path to each microinverter

# Enphase Grounding and the 2011 National Electrical Code

## Equipment Grounding and System Grounding Requirements

The Enphase M250-KS and M215-60-2LL-S22-IG meet the requirements of the National Electrical Code Systems that meet the Article 690.35 Ungrounded Photovoltaic Power Systems. NEC 690.35 allows for photovoltaic power requirements of NEC 690.35 are exempt from the requirements of NEC 690.41 System Grounding systems to be installed with ungrounded photovoltaic source and output circuits.

DC conductors are not bonded to ground and the microinverters do not require a GEC, but do require that grounding requires the installation of a grounding electrode conductor (GEC). In an Enphase system, the grounding path between a grounding electrode (I.E. ground rod or ufer) and a grounded system. System Equipment grounding provides for the grounding of metal equipment and enclosures and is generally System grounding provides the primary The NEC calls out two distinct types of grounding; equipment grounding and system grounding. provided for with equipment grounding conductors (EGCs). EGCs are provided for equipment grounding.

required to have equipment grounding provided to the metal frames, equipment, and enclosures in the system, but are not required to meet the requirements for system grounding. This means that a grounding electrode conductor (GEC) is not required to be installed to the enclosure of each Enphase The term ungrounded is somewhat misleading, because ungrounded photovoltaic systems are still Microinverter.

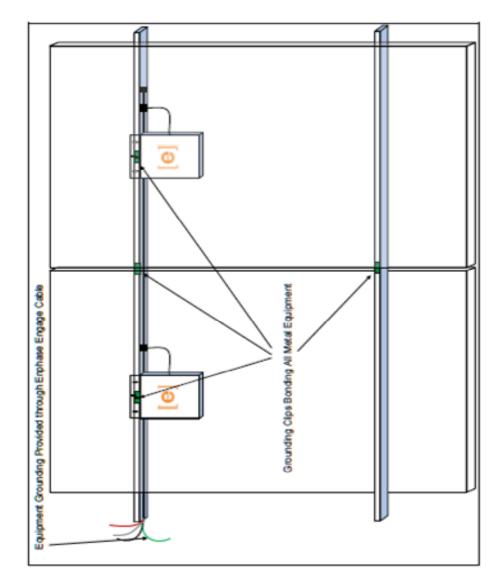

Systems that do bond the DC conductors of the photovoltaic source and output circuits must meet the which requires that the GEC be continuous and protected against damage. The grounding electrode installation requirements for the grounding electrode conductors (GEC) as called out in NEC 250.64, conductor (GEC) must also be a minimum #8CU conductor, as required by NEC 250.166.

## Equipment Grounding Requirements for an Enphase System

In an Enphase system with Integrated Ground Microinverters, the requirements for providing a GEC to the microinverters is removed, and only equipment grounding is required. In these systems, it is reasonable and safe to provide the equipment grounding through the Enphase Engage cabling NEC Article 690.43 Equipment Grounding specifies that all exposed non-current-carrying metal parts of PV module frames, electrical equipment, and conductor enclosures shall be provided with equipment grounding.

grounding the metallic frames of PV modules or other equipment shall be permitted to bond the exposed 690.43(C) Structure as Equipment Grounding Conductor allows for equipment to be used as the equipment grounding conductor in a photovoltaic system. Specifically, "Devices listed and identified for metal surfaces or other equipment to mounting surfaces."

In an Enphase microinverter system, if the microinverters and modules are bonded to the racking assembles with the use of listed and approved grounding clips or grounding components, then the equipment grounding conductor provided to the microinverters through the Enphase Engage cable may also be used to ground the other photovoltaic system components.

\*\*Aways check with your Authority Having Jurisdiction about your proposed grounding methodology prior to the installation of the system.

CN.

Enphase microinverters meet the requirements of NEC Article 690.35 for Ungrounded Photovoltaic Power systems. The article states

690.35 Ungrounded Photovoltaic Power Systems. Photovoltaic Power Systems shall be permitted to operate with ungrounded photovoltaic source and output circuits where the system complies with 690.35(A) through (G)

- (A) Disconnects. In an Enphase microinverter system the AC and DC connectors are the discomecting means.
- Overcurrent Protection. In an Enphase system, the AC circuit breaker or fused disconnecting feeding the branch circuit provides overcurrent protection for the inverter output circuit. As per 690.9(A) Exception (b), overcurrent protection is not required on the DC conductors. 8
- provided in the microinverter. In the Enphase microinverters with integrated grounding, the Ground Fault Protection. In an Enphase microinverter system, ground fault protection is ground fault protection is provided by a ground fault sensing circuit. Û
- The DC conductors must be PV Wire. The DC conductors in an Enphase Microinverter are PV Wire. ê
- - (E) Allowed for use in ungrounded battery systems
    (F) Labelling. The Enphase Microinverters are labeled as specified.
    (G) Listing. The Enphase Microinverters are listed for use in an ungrounded photovoltaic system.

en

APPENDIX G System Certification

The SOLARMOUNT system has been certified and listed to the UL 2703 standard (Rack Mounting Systems and Clamping Devices for Flat-Plate Photovoltaic Modules and Panels). This standard included electrical grounding, electrical bonding, mechanical load and fire resistance testing.

In conducting these tests, specific modules are selected for their physical properties so that the certifications can be mostly broadly applied. The following lists the specific modules that were tested and the applicability of those certifications to other modules that might come onto the market.

In addition to UL 2703 certification, Unirac performs internal testing beyond the requirements of certification tests in order to establish system functional limits, allowable loads, and factors of safety. These tests include functional system tests, and destructive load testing.

\*For transverse loads associated with using "C" Endclamps and 33 mm Modules, please see "Y±, Transverse w/33mm Module"

<u>Midclamp</u>: Part No. - 302027C, 302027D, 302028C, 302028D, 302029C, 302029D. Material - Stainless Steel 300 Series. Ultimate Tensile Strength - 85 ksi. Finish - Clear or Black Oxide. Weight - 0.05 lbs (23 g).

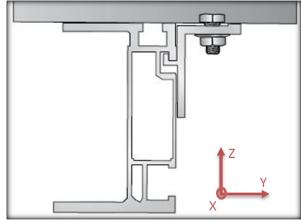

Endclamp: Part No. - 302021C, 302021D, 302022C, 302022D, 302023C, 302023D, 302024C, 302024D, 302025C, 302025D, 302026C, 302026D. Material - 6000 Series Aluminum Alloys. Ultimate Tensile Strength - 38 ksi. Yield Strength - 35 ksi. Finish - Clear or Dark Anodized. Weight ~ 0.06 lbs (26 g)

#### \*\*\*NOTE: See NOTES on Page H2.

#### SOLARMOUNT BOTTOM MOUNTING CLIP (SM HD ONLY)

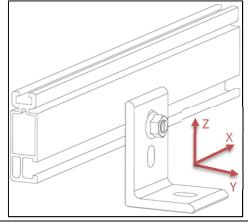

Bottom Mounting Clip (SM HD Only)						
	Allowable					
Direction	Load (lbs)	Load (lbs)				
	SM HD	SM HD				
X ±, Sliding	27	41				
Y ±, Transverse	329	497				
Z +, Tension	686	746				

Part No. 302000C

Bottom Mounting Clip Material: 6000 Series Aluminum Alloys Ultimate Tensile Strength: 38 ksi, Yield Strength: 35 ksi Finish: Clear Anodized

#### SOLARMOUNT L-FOOT

L-Foot with 3/8" T-Bolt							
Direction	Allowable	Load (lbs)	Design Load (lbs)				
Direction	SM/SM HD	SM LT	SM/SM HD	SM LT			
X ±, Sliding	565	594	854	898

Z +, Tension	938	603	1419	911			
Z -, Compression	1357	1297	2052	1962			

#### Part No. 304001C, 304001D

L-Foot material: 6000 Series Aluminum Alloys Ultimate Tensile: 38 ksi, Yield: 35 ksi Finish: Clear or Dark Anodized L-Foot Weight: 0.215 lbs (98g)

#### NOTES:

Allowable and design loads are valid when components are assembled according to authorized UNIRAC documents.

For the beam to L-Foot connection: Assemble with one Unirac <sup>3</sup>/<sub>8</sub>"-20 T-Bolt and one <sup>3</sup>/<sub>8</sub>"-20 ASTM F594 serrated flange nut.

Use anti-seize and torque the Midclamp, Endclamp, and Bottom Mounting Clip to 10 ft-lbs. Use anti-seize and torque the L-Foot to 30 ft-lbs.

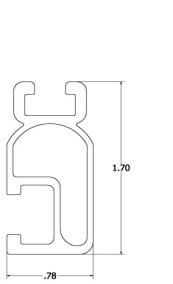

Values for the L-Foot and Bottom Mounting Clip represent the capacity of a single part when used with a SOLARMOUNT series rail to retain a module in the direction indicated.

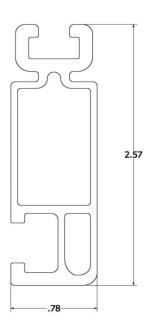

Assemble Midclamp and Endclamp with one Unirac 14"-20 T-Bolt and one 14"-20 ASTM F594 serrated flange nut.

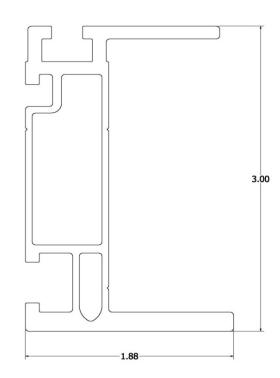

SM = SOLARMOUNT Standard Rail, SM HD = SOLARMOUNT Heavy Duty Rail, SM LT = SOLARMOUNT Light Rail

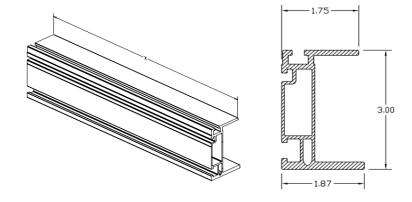

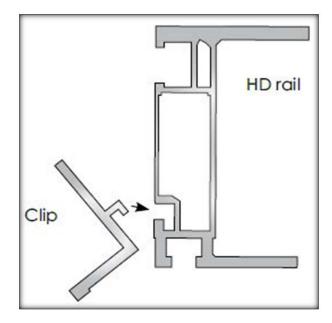

Properties	SOLARMOUNT Light	SOLARMOUNT Rail Profile 2	SOLARMOUNT HD	Units

APPENDIX I Solarmount HD Rail

The SOLARMOUNT Installation Guide and system certifications are equally applicable to SOLARMOUNT HD and Light rail. Unless otherwise noted, installation procedures for both are equivalent and sufficient to maintain system certifications. For maximum spans and cantilevers specific to SOLARMOUNT HD and Light rail, please refer to Appendix C and the SOLARMOUNT Installation Guide.

#### Bottom Mounting with SOLARMOUNT HD Rail:

Bottom mounting is no longer possible with standard SOLARMOUNT or Light rail, however, SOLARMOUNT HD still accommodates this mounting method. Should you elect to use bottom mounting clips to secure modules, please refer to the procedure below. NOTE: Bottom mounting of modules does not provide module bonding through clips and is not covered under the current UL 2703 certification.

Wrench size	* Recommended torque (ft-lbs)	$\wedge$
7/16"	10	- I
9/16~	30	
	size	size torque (ft-lbs)

Note:Torque specifications do not apply to lag bolt connections.

\*With anti-seize

Stainless steel hardware can seize up, a process called galling. To significantly reduce its likelihood, (1) apply lubricant to bolts, preferably an anti-seize lubricant, available at auto parts stores, (2) shade hardware prior to installation, and (3) avoid spinning on nuts at high speed. See Installation Supplement 910, Galling and Its Prevention, at www.unirac.com.
